1st strand cDNA was primed with a NotI-oligo(dT) primer. Five puend enriched, double-strand cDNA was digested with Not I and clainto the Not I and EcoR V sites of the pCMVSPORT 6 vector. Libra was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence clusters for more information - Library was constructed by Life Technologies, a sequence information - Library was constructed belongs to sequence clusters.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence
Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization to Cot5, and was constructed by Bento Soares and M. Fatima Bonaldo. "

NCI CGAP FT2 is a subtracted cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 3 hours; EPS 100 ng/ml, 24 hours; PMA 10 ng/ml, 3 hours; PMA 10 ng/ml, 24 hours; Klebsiella moi 10, 3 hours; Klebsiella moi 10, 24 hours; Staph aureus moi 10, 3 hours; Klebsiella moi 500, 24 hours; Meanoviral vector (Ad5 CMV eGFP), moi 500, 24 hours; Wt adenovirus moi 500, 3 hours; Wt adenovirus + LPS 24 hours; The library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. /note="Organ: Stomach; Vector: pCNS; Site_l: EcoRI;
Site_2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Top10F' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

/note="Organ: Lung; Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site_1: ECOR I; Site_2: Not I; NCI_CGAP_FT2 is a subtracted cDNA library constructed from a pool of 81 RNA samples from Alveolar Macrophages challenged with different treatments. The mRNA samples were a mixture of these conditions (times refer to incubations following isolation by bronchoalveolar lavage) (some normal donor macrophages were cultured in some of the conditions, other donor macrophages in different conditions). The mRNA samples were pooled for library construction. Control 0 hours; control 3 hours; control 24 hours; LPS 100 ng/ml, 3 hours; LPS 100 ng/ml, 24 hours; pMA 10 ng/ml, 24 hours; Klebsiella moi 10, 3 hours; Klebsiella moi 10, 3 hours; Staph aureus moi 10, 24 hours; Staph aureus moi 10, 3 hours; Staph aureus moi 500, 3 hours; Madenovirus moi 500, 3 hours; Wt adenovirus moi 500, 24 hours; wt adenovirus moi 500, 24 hours; wt adenovirus hours; wt adenovirus hours; wt adenovirus hours; the library was subtracted according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. The tissue was provided by Dr. Gary W. Hunninghake of the University

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five plend enriched, double-strand cDNA was digested with Not I and clointo the Not I and EcoR V sites of the pCMVSPORT 6 vector. Librawas normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluste
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5445.

strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
strand cDNA was digested with Not I and cloned
enriched, double-strand cDNA was digested with Not I and cloned
the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library
normalized. Library was constructed by Life Technologies, a
ision of Invitrogen. This sequence belongs to sequence cluster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   // Aay 5, 2005 ...._

The CDS has been inserted into pDONR201 via a BP Clonase(TM) reaction. Additional sequence has been added in front of the st codon: att. .AAAAAA GCA GGC TCC ACC (ATG).
The stopcodon is followed by the 3' att site: GACCCAGCTTTCTT..
The clone is validated by full sequence check.
Compared to the reference sequence NM_002451 (GI:6006025) we fo AA exchange(s) at position (first base of changed triplet):
139(leu->met) 166(ile->val)

ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which

New isolated nucleic acid that is differentially expressed in cancer tissues useful for determining the presence of colon cancer in a cell tissue type, and in antisense therapy.

combination therapies comprise administering an inhibitor of glycinamide ribonucleotide formyltransferase (GARFT) and/or aminoimidazolecarboximide ribonucleotide formyltransferase (AICARFT), and administering an antitoxicity agent during and after administration of the inhibitor. The combination therapies can be used for selectively killing MTAP deficient cells, and for treating cell proliferative disorders e.g. lung cancer, leukaemia, glioma, urothelial cancer, colon cancer, breast cancer, prostate cancer, pancreatic cancer skin cancer and head and neck cancer. The anti-toxicity agent counteracts the toxicity of the inhibitor in the MTAP-competent (i.e. healthy) cells and increases the maximally tolerated
                                                                                                                                    This
                                                                                                                                                                                                                                                                                   Bloom La

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SSXSS
                                                                AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Ma

The invention relates to 971 novel human cDNA sequences (ADC29919-CC ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods to geventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of invention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC33294). The nucleic acids and polypeptides of the invention are identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human cDNA sequence of the invention. Note: The sequence data for obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

A cyclin-dependent protein-kinase-4-inhibitor (CDK4I) tumour suppressor gene (AAT15157-58) is located between this gene and an interferon-alpha gene cluster, and has been isolated by chromosome walking. The CDK4I gene, probe and primer derivatives and the gene product may be used in diagnosis of cancer, particularly melanoma (especially dysplastic nevus syndrome), glioma, non-small cell lung carcinoma or leukaemia. The gene may also be used in cancer gene therapy, or in antitumour antisense oligonucleotide or ribozyme construction. Antibodies against CDK4I may be used in diagnosis or in vivo imaging
                                                                                                                                                                                                                                                                                                                                                    Homo

creened (sequence

This DNA sequence comprises human genomic DNA for methylthicadenosine phosphorylase (MTase), obtained from a cosmid gene library constructed from human placenta DNA by screening with a MTase cDNA probe. A claimed method for inhibiting the activity adenylsuccinate synthetase (ASS) in mammalian cells deficient in MTAse activity involves: (a) determining

cosmid

The method is especially used to treat human MTAse-deficient primary tumour cells, specifically non-small cell lung cancer, acute lymphoblastic leukaemia (ALL), glioma and urothelial tumour cells. MTAse catabolises methylthioadenosine to adenine for endogenous salvage incorporation into the intracellular AMP pool. The claimed method deprives the cells of substrate for de novo synthesis of AMP, resulting in selective killing of these cells. MTAse sequence-specific oligonuclotides can be used to detect the presence or absence of MTAse in malignant cell lines
                                                                                                                                   exon
                                                                                                                                                                                                    exon
                                                                                                                                                                                                                                                                     exon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for detecting catalytically active and inactive methylthioadenosine phosphorylase (MTAse) in mammalian cells, using oligonucleotide probes which hybridize to MTAse nucleic acid coding regions. Detection of MTAse encoding nucleic acid indicates the cell has catalytically active MTAse encoding nucleic acid for detecting malignant cells with a deficient MTAse gene, useful for identifying malignant cells which are suitable targets for methionine (MET) starvation therapy. The new method is simple, efficient and successful at determining MTAse negative cells, unlike prior art techniques, which include analysis of catalytic activity in cell cultures, requiring a commercially unavailable radiochemical substrate, and immunoassays, using MTAse antibodies which are unable to be produced in sufficient quantities. Recombinant MTAse protein produced using the new polynucleotide and vector, allows greater and purer production of MTAse than prior art techniques (using the Rangione method) for isolating native MTAse. This sequence represents human MTAse encoding DNA which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Ma

                                The present invention relates to novel tumour suppressor genes, termed as cyclin-dependent kinase 4 inhibitor (CDK4I) genes and their corresponding proteins. The polynucleotides are useful for preparing a composition for diagnosing or treating cancer. Sequences of the invention are also useful in gene therapy. The present sequence is human methylthioadenosine phosphorylase (MTAse) genomic DNA used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention (ASS) activity in meth cells of mammalian hos cancer, especially bre

                                                                                                 Antigenic peptides may be generated from this sequence encoding methyladenosine-phosphorylase, which are then used to generate antibodies specific for MTAse. The produced antibodies may be used in an immunoassay for the detection of MTase
                                                                                                                                                                                                                                                                                                                                                                    Key
